- Environment & Sustainability

ECHY is a French start-up that offers an environmentally friendly alternative to using electric lighting in offices and other public buildings during the daytime.

The system works with a network of panels that are fixed on a sunlight tracking system. They capture and absorb natural light from the outside and then transport it via fibre optics into buildings.

Harnessing natural light for our work and living spaces not only saves on electricity but can also contribute to our health and well-being.
